DECK PERMIT REQUIREMENTS  
LA CRESCEENT, MINNESOTA

The following information must be submitted to the building department before a deck permit can be processed and approved, more detailed information is listed below

After a preliminary review, additional information may be required.

Complete the online application, include the General Contractors License Number. A site plan, drawing of proposed deck with structural details for the proposed deck are required at the time of the permit application. You can attach your drawings to your online application.

**General Information**

**When is a Deck Permit Required?** A building permit is required for all decks that are either:
- When a deck or platform is part of an accessible route (Accessible route refers to the designated main entry of the dwelling as required by code).
- attached to a structure with frost footings
- more than 30” above grade.

**Required Inspection:**
- A footing inspection is required when the holes have been dug (Minimum 42” deep) but before the concrete is poured.
  **Cement “cookies” are not allowed.**
- The final inspection to check the framing, guards, stairways and handrails.

If the deck is being completed on a weekend the inspection should be scheduled for the following Monday.

**Fees:** Are determined by the value of the proposed deck, including all labor and materials, (even if the homeowner will be doing the work).

**Questions:** If you have any questions, please contact the Building Department, Monday through Friday, 7:30 a.m. to 4:00 p.m. at 507-895-4409, or write to, swetterlin@cityoflacrescent-mn.gov, Shawn Wetterlin-Building Official, 315 Main Street, City of La Crescent, Minnesota, 55947.
General requirements and building permits

Effective March 31, 2020, residential exterior decks must be designed and constructed using the 2020 Minnesota Residential Code (MRC), related standards, manufacturer installation instructions, best practices and local jurisdiction zoning codes and ordinances.

Building permits are required:
- When a deck or a platform is more than 30 inches above adjacent grade.
- When a deck or platform is attached to a structure with frost footings.
- When a deck or platform is part of an accessible route (Accessible route refers to the designated main entry of the dwelling as required by code).

Deck materials

All wood used in deck construction must meet requirements of MRC R507.2.1. This includes the grade of the wood (No. 2 or better), preservative treated or naturally durable lumber that has approval by the local jurisdiction. Preservative-treated wood must be appropriate for the installation and meet the American Wood Protection Association’s (AWPA) UC3 (above ground) or UC4 (ground contact) use categories. All cuts, notches and holes in preservative-treated wood requires field treatment (MRC R317.1.1). All engineered wood products must meet the requirements in MRC R502.

Exterior deck boards, stair treads, guards or handrails made of plastic composite materials must meet certain performance standards in American Society for Testing and Materials (ASTM) D7302. Labels on materials or packaging will indicate compliance. Follow manufacturer's installation instructions for plastic composite materials.

Fasteners and connectors

Requirements for fasteners are in MRC Table R507.2.3 and R317.3. Fasteners (including nuts and washers) used in preservative-treated wood must be hot-dipped, zinc-coated galvanized steel, stainless steel, silicon bronze or copper. Staples used in preservative-treated wood must be stainless steel. Metal connectors in contact with preservative-treated wood should follow manufacturers recommendations and MRC Table R507.2.3.

Holes for bolts must be drilled between 1/32 and 1/16 of an inch larger than the bolt. Lag screws 1/2 inch or larger should be predrilled to avoid wood splitting.

Footings

Decks are required to be supported on concrete footings or other approved structural systems designed to accommodate all loads in accordance with the MRC. The use of alternative footings must be reviewed for approval by the local building safety department. Footings must be sized to bear loads and suitable for allowable soil-bearing
pressure (MRC Table R401.4.1). The minimum depths of footings must be either 5'-0" (Zone 1) or 3'-6" (Zone 2). Refer to Minnesota Rules 1303.1600 for the counties included in each zone.

**Deck posts**
Deck post sizing requirements are in MRC Table R507.4 and are limited to single-level wood-framed decks when sizing the decks other structural components with MRC Table R507.5. The height of the post shown in MRC Table R507.4 is measured from the underside of the beam to the top of the footing. Deck posts are based on using a 40 psf live load for structural member size calculations. Metal connectors must be provided at the top and bottom of posts for lateral restraint.

**Beams**
Allowable deck beam span lengths can be determined in MRC Table R507.5. Examples of the flush beams and dropped beams can be seen in the examples shown. Measurements of deck beam lengths need to be from center of post to center of post. The spans used in the table are based on a live load of 40 psf, a dead load of 10 psf, supporting deck joists from one side only and the beam depth must be greater than or equal to the joist depth when using a flush beam configuration. Beam plies shall be fastened with two rows of 10d (3-inch x 0.128-inch) nails or approved fasteners a minimum of 16 inches on center. Beams are allowed to cantilever up to one-fourth of their allowable span at each end.

Ends of beams used in splices must have a minimum of 1-1/2 inches of bearing on wood and 3 inches on concrete.

Multiple-span beams must have full bearing on posts (MRC Figures R507.5.1(1) and R507.5.1(2)). Those figures also show beam-to-post connections with metal connector plates and bolts and nuts configurations that are required by MRC R507.5.2.

**Joists**
Allowable spans for joists are in MRC Table 507.6. The live load used in the table is 40 psf and a dead load of 10 psf. The maximum cantilever length is determined by the lesser of one-fourth of the joist span or the maximum cantilever length shown in MRC Table 507.6. Joist spacing is limited by the span rating of the decking being used, see MRC Table R507.7.

Deck joists require a minimum of 1-1/2 inches of bearing on wood and 3 inches on concrete. Joist bearing on top of a single-ply beam or ledger shall be attached by a mechanical connector. Use the fastener schedule (MRC Table R602.3(1)) for fastening joists to a multiple-ply beam. Use an approved joist hanger for joist framing into the side of a beam or ledger board.

Where joist hangers or blocking are used, 60-percent of the joist depth must be restrained. If a rim joist is being used, not fewer than three 10d (3-inch x 0.128-inch) nails or three No. 10x 3-inch-long wood screws are required.
Decking
Use at least two 8d threaded nails or two No. 8 wood screws to attach wood decking to the joist. Other approved decking or fastener systems shall be installed in accordance with the manufacturer’s installation requirements.

Ledger and band joist
A ledger board attached to the exterior wall of the primary structure must be at least 2-inch by 8-inch nominal. Pressure-preservative-treated Southern pine, incised pressure-preservative treated hem-fir, or approved, naturally durable, No. 2 grade or better lumber. Deck ledgers must not support concentrated loads from beams or girders and cannot be supported on stone or masonry veneer.

Band joists supporting a ledger must bear fully on the primary structure and be capable of supporting all required loads. Fasteners used in deck ledger connections in accordance with MRC Tables R507.9.1.3(1) shall be hot-dipped galvanized or stainless steel and shall be installed in accordance with Table R507.9.1.3(2) and figures R507.9.1.3(1) and R507.9.1.3(2). Where connections to the primary structure cannot be verified during inspection, decks must be self-supporting.

Lateral support
Lateral-load connection devices must be installed to transmit the lateral loads imposed on the deck to the ground. The lateral-load connection device shown in MRC Figure R507.9.2(1), with the threaded rod and connection points on the deck joist and the primary structure floor system, must be installed in two locations on the deck a minimum of 24 inches from the ends. Each device must have an allowable stress design capacity of at least 1,500 pounds.

Where the lateral load connections are provided in accordance with Figure R507.9.2(2), the hold-down tension devices must be installed in at least four locations per deck, and each device must have an allowable stress design capacity of at least 750 pounds. Hold-down tension devices are required to be installed per the manufacturer’s instructions.
THINK YOU MIGHT ENCLOSE YOUR DECK IN THE FUTURE?
Deck plans are approved on the assumption that the deck will be used only as a deck for the life of the structure. Because footing sizes, setbacks, structural supports, and a host of other deck components are different for enclosed spaces than they are for decks, it is important that you indicate on your plans the desire to convert the deck at a future date. You should then design your deck to carry future loads and meet setbacks and other rules.

ZONING REGULATIONS

Decks are permitted as an addition to a dwelling in a side or rear yard or as a freestanding structure. An accurate site plan/survey showing the deck location must be submitted with the construction plans for review. Setbacks are routinely checked as a part of the plan review and again at the time of the footing inspection. Unless otherwise permitted by the Building department, lot lines must be marked and survey markers exposed. A site inspection may be required to verify actual deck/stair locations.

Easements, wetland buffer zone, and other lot restrictions may require greater setbacks than should be directed to the Planning and Zoning Office at

ELECTRICAL

NEC 210.52(E)(3) Balconies, decks and porches, regardless of size, that are accessible from inside a dwelling unit shall have at least one receptacle installed within the perimeter.

R303.7 Exterior stairways shall be provided with a means to illuminate the stairs, including the landings and treads. Exterior stairways shall be provided with an artificial light source located in the immediate vicinity of the top landing of the stairway.

The illumination of exterior stairways shall be controlled from inside the dwelling unit.

Exception: Lights that are continuously illuminated or automatically controlled.

MATERIALS

Fasteners

Nails and other hardware must be hot-dipped zinc-coated (galvanized), stainless steel or equal. Screws should be either hot-dipped galvanized or electroplated with a polymer coating. 12d nails are recommended on nominal 2-inch decking. 10d nails are recommended for 5/4" decking.

With lag screws, use a flat washer under the head. Use washers under the nut and head of machine bolts and just under the nut of carriage bolts.

Lumber

All wood used in deck construction must be pressure treated lumber or wood that is naturally resistant to decay such as redwood or cedar.

Wood used above ground, in contact with the ground, or below grade requires different degrees of treatment. Check the labels of the material you are buying to determine where it can be used. Because some preservative treatments are very corrosive, make sure that any fasteners or metal connectors used in the construction of your deck are approved by the manufacturer for use with treated wood.

DECKING

Materials commonly used for decking include standard dimension lumber (either 2X4 or 2X6), radius-edged decking, or a manufactured decking product.

Radius-edged Patio Decking (5/4 decking) has been specifically developed for outdoor decks. Redwood and cedar patio decking is intended to be used flat-wise in load-bearing applications where spans do not exceed 16” o.c. (12” o.c. when installed diagonally to joists). Southern pine decking may span 24” o.c. or 16” o.c. when installed diagonally to joists.

<tr>
<td>Plastic composite</td>
<td>In accordance with Section R507.2</td>
</tr>
</tbody>
</table>

For SI: 1 inch = 25.4 mm, 1 foot = 304.8 mm, 1 degree = 0.01745 rad.

<sup>a</sup> Maximum angle of 45 degrees from perpendicular for wood deck boards.
Manufactured decking products maybe used only when meeting ASTM D 7032 or when approved by the Building Department. Approval is based on the material carrying an ICC Evaluation Services Report. Decking without a report may not be approved. Ask the decking supplier to provide you with a copy of the research report. The Building Department maintains a list of composite decking materials that meet US building codes that is available upon request. Caution—some manufactured deck products are approved for decking but not for stair treads. In some cases, where manufactured decking is approved for stairs, the spacing of supports maybe significantly reduced compared to use on the deck itself. Read the research report for further information.

</table>

**FOOTINGS**

Footings supporting a 4x4 column must be not less than 6-inch diameter. Post footings supporting columns larger than 4x4 must be 8-inch diameter or larger. The bottom of post footings may be “belled” to achieve the desired minimum bearing area. The base of the footing must be at least 42 inches below finished grade. Rebar is recommended. Center the column on the footing secured by a pin or connector. Pots imbedded in the ground must be 60% C.C.A. or equal. Using a fiberboard tube will allow elevation of the top of the footing above finished grade to provide protection of the wood post from lawn mowers and trimmers.

**UNDERSTANDING LOAD PATHS**

![Diagram showing load paths](image_url)

Loads are assumed to be uniform across the floor.

Deck footings should be sized according to the following table. Footings must extend at least 42 inches below grade (frost line) except for decks that are not connected to a dwelling. The minimum compressive strength of concrete used for deck footings is 2500 psi.

**TABLE R507.3.4**

<table>

</tbody>
</table>

For SI: 1 inch = 25.4 mm, 1 square foot = 0.0929 m², 1 pound per square foot = 0.0479 kPa.

- a. Interpolation permitted, extrapolation not permitted.
- b. Live load = 40 psf, dead load = 10 psf.
- c. Assumes minimum square footing to be 12 inches x 12 inches x 6 inches for 6 x 6 post.
- d. If the support is a brick or CMU pier, the footing shall have a minimum 2-inch projection on all sides.
- e. Area, in square feet, of deck surface supported by post and footings.
Required footing sizes are determined by calculating the area of the deck supported by each footing. Loads shall be assumed to be equally shared between the supporting elements. Do not overlook cantilevers. The minimum compressive strength of concrete used for deck footings is 2500 psi.

The required area of the column should fully bear on the footing.

The minimum compressive strength of concrete used for deck footings is 2500 psi.

Where do I put my footings?

The intersection of your string lines is not the center of the footing. Adjust according to the location and size of your column.
ANCHORING POST BASE

Follow manufacturers installation specifications.

Not allowed - connection must be made using a field inspectable means of connection.

DECK FRAMING ATTACHMENT OF LEDGER BOARD TO WOOD JOISTS (2X6, 2X8, 2X10, 2X12)
(Caution: 2x6 and 2x8 joists will require underside floor protection with 5/8" treated plywood)

Make sure the ledger is securely attached to the dwelling, install metal flashing at top and caulk sides.

a. The tip of the lag screw shall fully extend beyond the inside face of the band joist.
b. The maximum gap between the face of the ledger board and face of the wall sheathing shall be ⅛ inch.
c. Lag screws shall be flushed to prevent water from contacting the house band joist.
d. Lag screws and bolts shall be staggered in accordance with Section RS07.2.1.
e. Deck ledgers shall be minimum 2x8 pressure-preservative-treated No. 2 grade lumber, or other approved materials as established by standard engineering practice.
f. When solid-sawn pressure-preservative-treated deck ledgers are attached to a minimum 1-inch-thick engineered wood product (structural composite lumber, laminated veneer lumber or wood structural panel band joist), the ledger attachments shall be designed in accordance with accepted engineering practice.
g. A minimum ⅜ inch Douglas Fir laminated veneer lumber rimboard shall be permitted in lieu of the 2-inch nominal band joist.
h. Wood structural panel sheathing, gypsum board sheathing or foam sheathing not exceeding ⅜ inch thickness shall be permitted. The maximum distance between the face of the ledger board and the face of the band joist shall be ⅛ inch.

Capacity of lag or carriage bolts shall not exceed 400 lb's per bolt unless design provided.

a. Lag screws or bolts shall be staggered from the top to the bottom along the horizontal run of the deck ledger in accordance with Figure RS07.2.1(d).
b. Maximum 5itches.
c. For engineered rim joists, the manufacturer's recommendations shall govern.
d. The minimum distance from bottom row of lag screws or bolts to the top edge of the ledger shall be in accordance with Figure RS07.2.1(d).
PLACEMENT OF LAG SCREWS AND BOLTS IN BAND JOISTS

- Exterior Sheathing
- Existing Stud Wall
- Existing 2x Band Joist or Engineered Rim Board
- Deck Joist
- Lag Screws or Bolts
- Floor Framing
- Joist Hanger
- Existing Foundation Wall

1/2" Diameter Lag Screws Minimum

- Lag screws must be hot-dipped galvanized or stainless steel only
- Shank length must extend through existing band joist
- Screw must penetrate beyond band board a minimum of 1/2"
LEDGER FLASHING DETAIL

LATERAL LOAD CONNECTIONS TWO
MINIMUM PER DECK
(See “Alternate Methods” page 10)

- HOLD-DOWN TENSION DEVICES MUST BE INSTALLED IN NOT LESS THAN TWO LOCATIONS PER DECK
- EACH DEVICE MUST HAVE AN ALLOWABLE STRESS DESIGN CAPACITY OF NOT LESS THAN 1600 POUNDS.
- FLOOR SHEATHING IN THE DWELLING MUST BE NAILED TO THE JOISTS TO WHICH HOLD DOWNS ARE CONNECTED AT 8" MAXIMUM O.C.
- ALTERNATIVELY THE DECK MAY BE DESIGNED TO BE SELF SUPPORTING OR A DESIGN MAY BE PROVIDED BY A LICENSED DESIGN PROFESSIONAL.
FLOOR JOISTS PERPENDICULAR TO DECK LEDGER

- FLOOR JOIST
- FLOOR SHEATHING NAILED 6" O.C.
- 1 1/2" MAX. OFFSET
- DECK JOIST
- DECK LEDGER
- HOLD DOWN TENSION DEVICE
- 1/2" DIAMETER THREADED ROD
- RIM OR BAND JOIST

FLOOR JOISTS PARALLEL TO DECK LEDGER

- FLOOR JOISTS
- FLOOR SHEATHING NAILED 6" O.C.
- RIM OR BAND JOIST
- DECK LEDGER
- HOLD DOWN TENSION DEVICE
- 1/2" DIAMETER THREADED ROD

WHEN THERE IS NO ACCESS TO THE TOP OF THE FLOOR SHEATHING

INSTALL APPROVED CONNECTORS PER THE MANUFACTURER'S INSTALLATION INSTRUCTIONS

IN ALL CASES, MANUFACTURER'S INSTALLATION INSTRUCTIONS MUST BE FOLLOWED
**ALTERNATIVE DECK LATERAL LOAD CONNECTORS** (or approved equivalent)

**LTS19-TZ**

Deck Lateral Load Connector

The LTS19-TZ holdown can be used to build stronger, safer, deck structures. It will meet the new lateral connection requirements outlined in the 2015 International Residential Code (IRC) by attaching deck floor joist members to the main structure. The LTS19-TZ can also be used for deck rail post reinforcement.

**Materials:**
- Studs: 16Ga G-185 galvanizing
- Washer: 3Ga USP primer
- Codes: ER-200, FL14900

**Installation:**
- The LTS10-TZ must be installed flush to the surface of the outside wall of the home.
- Use the building code specified 3/8" lag screw and washer to secure the base of the LTS19-TZ to the main house structure. The minimum embedment depth for the lag screw is 3".
- Tighten lag screw until snug to the base of the LTS10-TZ, with a wrench or socket, to prevent loosening of the lag screw.
- Use all specified 10d common nails to attach the strap portion of the connector to the bottom of the deck floor joist.
- See additional installation instructions on detail drawing.

---

**SIMPSON Strong-Tie**

**DTT Deck Tension Ties**

DTT tension ties are safe, cost-effective connectors designed to meet or exceed code requirements for deck construction. These versatile DTT connectors are also load rated as a holdown for light-duty shear walls and braced wall panel applications.

For new construction or to make an existing current deck code-compliant, the DTT12Z can be used as a tension-tie to satisfy the 2015 IRC provision for a 750 lbs. lateral load connection to the house at four locations per deck. This new code detail permits the lateral connection from the deck joints to be made to top plates, studs, or headers within the supporting structure, which eliminates the need to access to the floor joists inside the home.

The new DTT12Z fastens to the narrow or wide face of a single 2x with Simpson Strong-Tie® Strong-Drive® SD Connector screws or nails and accepts a 1/4" machine bolt, anchor bolt, or lag screw (washer required) or can be installed with the new Strong-Drive SDWH Timber-Hex HDG screw with an integral washer. The DTT2 fastens easily to the wide face of a single or double 2x using Simpson Strong-Tie® Strong-Drive SDS Heavy-Duty Connector screws (included) and accepts a 1/4" machine bolt or anchor bolt.

**Material:** 14 gauge
**Finish:** DTT12Z/DTT2Z—ZMAX® coating; DTT25SS—Stainless steel; see Corrosion Information, pages 13-16.

**Installation:**
- Use all specified fasteners. See General Notes.
- A standard cut washer (included) must be installed between the nut and the seat.
- Simpson Strong-Tie Strong-Drive SDS Heavy-Duty Connector screws install best with a low speed high torque drill with a 1/4" hex head driver.
- Strong-Drive SD Connector screws install with a 1/4" hex head driver.
- Strong-Drive SDWH Timber-Hex HDG screws install with a 1/4" hex head driver.
TABLE R607.4
DECK POST HEIGHT*

<table>

For SI: 1 inch = 25.4 mm, 1 foot = 304.8 mm, 1 pound per square foot = 0.0479 kPa.

a. Measured to the underside of the beam.
b. Based on 40 psf live load.
c. The maximum permitted height is 6 feet for one-ply and two-ply beams. The maximum permitted height for three-ply beams on post cap is 6 feet 9 inches.

THIS 4' X 12' PORTION OF THE DECK IS SUPPORTED BY THE HOUSE

V-48
JOIST SPAN:
From house to beam OR beam to beam.

16" or 16" or 16"

COMMON JOIST SPACING IS 16" ON CENTER MEASURED IN ANY OF THE WAYS SHOWN

Joist spacing is determined by the type of decking used. 16" o.c. spacing must be used with 5/4 decking or when 2x6 or 2x4 decking is used at a 45° angle. 12" o.c. spacing required when 5/4 decking is used at a 45° angle.

WOOD DECKING

CONVENTIONAL HANGER

CONCEALED FLANGE HANGER

OVERLAPPED JOISTS

STRAP TIE

FILL ALL NAIL HOLES!
Joists must bear on a beam, ledger strip, or joist hangers. Joist hangers must be installed in accordance with the manufacturer's recommendations. **Fill all nail holes in joist hangers.**

**RIM JOIST ATTACHED TO LEDGER WITH CONCEALED FLANGE HANGER**

**RIM JOIST ATTACHED TO LEDGER BY END NAILING - NOT ALLOWED**

Ledger end grain nailing not allowed. Joists require 1-1/2" bearing. Use approved concealed flange hanger.
CANTILEVERS
THE AMOUNT OF CANTILEVER IS LIMITED BY THE SIZE AND SPACING OF THE JOIST AND THE LENGTH OF THE BACKSPAN.

SPECIAL FLOORFRAMING DETAILS
SEE THE ILLUSTRATION AT THE TOP OF PAGE TOP OF PAGE 7 FOR MORE DETAILS ON LEDGER ATTACHMENT.

WARNING: DO NOT EXCEED CAPACITY OF CONNECTORS WHEN SUPPORTING ENDS OF BEAMS.

WARNING: CAPACITY OF LAG OR CARRIAGE BOLTS SHALL NOT EXCEED 400 LB'S PER BOLT UNLESS DESIGN PROVIDED.

THE COMPLETED STAIR
5 equal risers of 7 3/8"
Stairs must have a maximum rise of 7 3/4 inches and a minimum run of 10 inches measured as shown. The greatest riser height within any flight of stairs shall not exceed the smallest by more than 3/4 inch. The greatest tread depth within any flight of stairs shall not exceed the smallest by more than 3/4 inch. Open risers are permitted provided that a 4" diameter sphere will not pass between the treads when stairs are over 30" above grade.

Stairs must be a minimum of 36 inches wide above the handrail and 31 1/2 inches below the handrail.

**STAIR TERMINOLOGY**

- The maximum riser height is 7 3/4 inches.
- The minimum tread run is 10 inches.
- Treads and risers should be approximately equal with the largest not exceeding the smallest by more than 1/4 inch.

**DETERMINING RISE/RUN**

Example:
- Assume that H equals 37 inches.
- Divide 37" by 7 3/8" (37" ÷ 7 3/8" = 4.8).
- Rounding up to the next whole number gives the number of risers.
- There will be 5 risers.
- Divide 37" by 5 (7 3/8" or about 7 3/8") = 7 3/8" per riser.
- For 5 risers there will be 4 treads.
- Since each tread must be at least 10", the length of the stair from the face of the deck to the face of the bottom riser will be at least 60" (10" x 6 treads = 60"").

**LAYING OUT STAIR JACKS**

- Cut an amount equal to the thickness of the tread from the bottom of the stair jack.
- Set your square at the rise and run calculated previously.

**THE COMPLETED STAIR**

- Top of stair jack must be 7 3/8" x the thickness of the tread from top of finished deck floor.
- 4 equal runs of 10"
- 5 equal risers of 7 3/8"

**TREADS: 2X6 SOUTHERN PINE 2X8 OR LARGER FOR OTHER SPECIES**

- 16" Max.
- 19" Max.
- Min. of 3 cut stringers
- 36" Max.

V-52
STAIR STRINGER SPANS
LANDINGS OR COLUMNS AND BEAMS MAY BE USED TO SHORTEN STRINGER SPANS

CUT STRINGER

SOLID STRINGER

STAIR ATTACHMENTS

GUARDS AND HANDRAILS

Guards and handrails must be provided as shown on the following illustrations. Guards must continue down stairs where the stair is more than 30 inches above grade. The height of guards on stairs must be 34 inches minimum.

Handrails must be provided on at least one side when there are four or more risers. Handrails must have returns on each end or terminate in a newel post. Other handrail shapes having an equivalent gripping shape may be used with prior approval of the Building Department.

V-53
Handrails must be continuous for the entire length of the stairs and may not be interrupted by newel posts except at landings.

Handrails and guards must be designed to support a 200lb load applied in any direction at any point along the top of the guard or rail.

Landing shall span full width of stairs & extend a minimum of 36 inches in the direction of travel. Stairs must bear on structural material (i.e. treated lumber, concrete, gravel) and be permanently restrained from lateral movement.

Guard required if more than 30"
HANDRAILS MUST RETURN TO NEWEL POST AND BE CONTINUOUS WITHOUT INTERUPTION FOR THE LENGTH OF THE FLIGHT INTERUPTION FOR THE LENGTH OF THE FLIGHT
avoid notching guard posts

blocking may be added to strengthen post attachment

Examples of devices that can be used to resist horizontal loads

composites and other deck/railing products

Wood/plastic composites used for exterior deckboards, stair treads, handrails, and guardrail systems must bear labels indicating compliance with ASTM D 7031 or a current ICC Evaluation Services Report must be made available.

Wood/plastic composites complying with ASTM D 7031 must be installed in accordance with the manufacturer's written installation instructions.

Wood/plastic composites having an ICC ES Report must be installed in accordance with the manufacturer's installation instructions and the report.

READ THE INSTRUCTIONS AND THE REPORTS CAREFULLY. ALL PRODUCTS HAVE SPECIFIC REQUIREMENTS FOR STAIR TREADS. SOME ARE LIMITED TO INSTALLATION PERPENDICULAR TO JOISTS ONLY.

PRODUCTS MADE OF ALUMINUM, STEEL, GLASS, OR ANY OTHER MANUFACTURED PRODUCT MAY BE USED IF THE MANUFACTURER HAS A RESEARCH REPORT FROM THE INTERNATIONAL CODE COUNCIL AND THE PRODUCT IS INSTALLED IN STRICT ACCORDANCE WITH THAT REPORT OR SITE SPECIFIC ENGINEERING IS PROVIDED.
